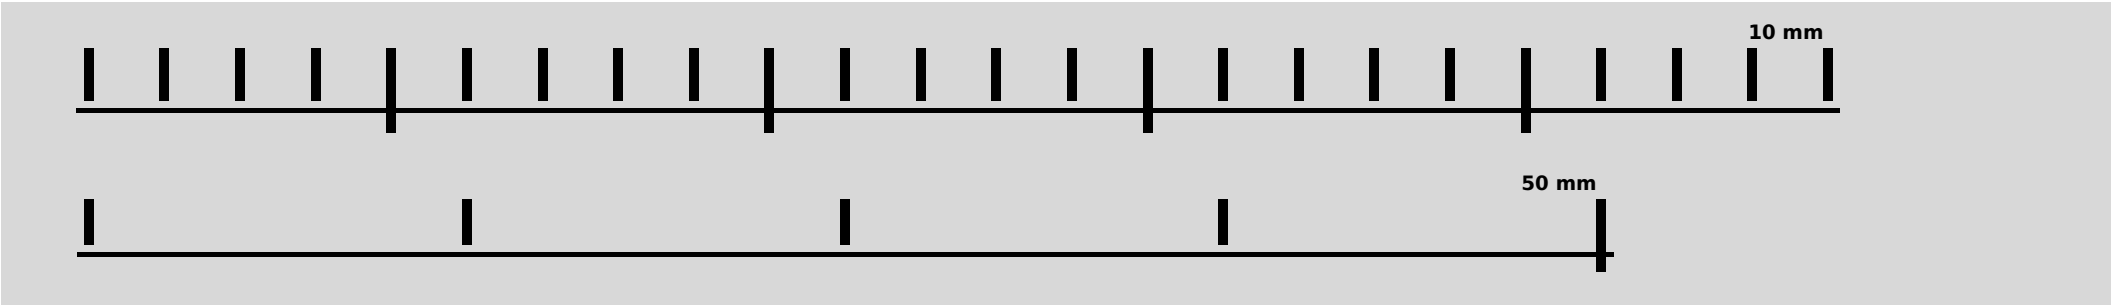
AGE CORE PHOTO CARD v4 - LANDSCAPE

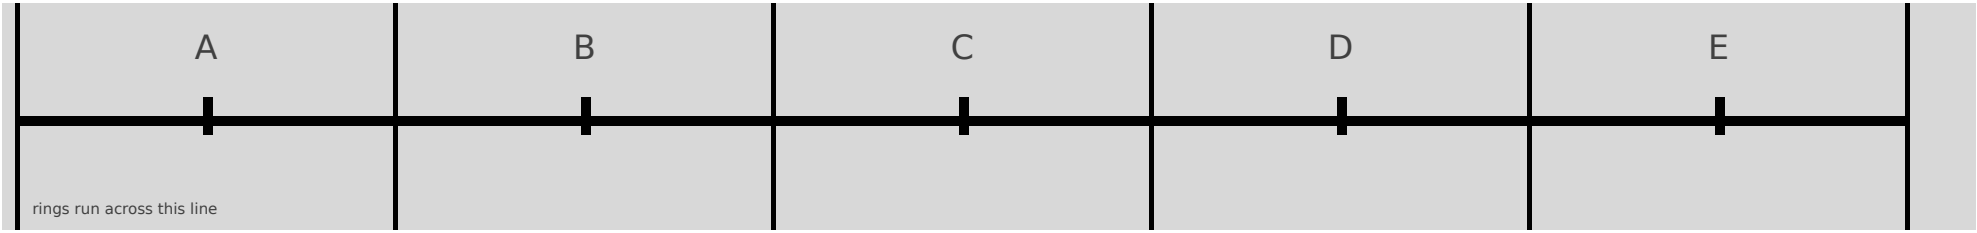
cores to 250 mm - scale from your ruler

CALIBRATION LANE - keep clear of cores

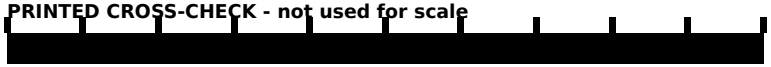


10 mm comb: 24 marks, 230 mm baseline. 50 mm comb is a second pitch - the two must agree, or print or lens is at fault.

CORE STRIP - 5 bays x 50.00 mm = 250.00 mm



PRINTED CROSS-CHECK - not used for scale



nominal 100.00 mm

OPTICAL RESOLUTION TARGET

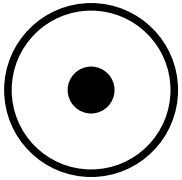
2 1 0.7 0.5 0.35

mm per black/white pair - the finest group still resolved is the real limit at the core's distance

grey ref

white ref

sanity check only



5 mm core dia.

HOW TO USE

1 Landscape card, cores to 250 mm. Bays A-E are 50.00 mm each, so a 250 mm core fills them exactly.

2 Lay an opaque ruler across the top lane. The app measures its millimetre graduations, not this page.

3 Ruler origin does not matter: only the graduation pitch is used. Edge and 0 mark may differ.

4 Place the core in the strip and keep it clear of the calibration lane above.

5 A core from a 5 mm increment drill is about 5 mm across. The ring at right is a rough check only.

6 The printed 100 mm bar is a drift check. It is printed, so do not scale to it.

v4 landscape: scale is measured from a physical ruler. A printed card cannot be its own reference - v2 printed 7% small.

PRINT LANDSCAPE AT 100% - do NOT scale to fit. Matte paper only.
